

LP3869x/-Q1 500mA 低压降 CMOS 线性稳压器

使用陶瓷输出电容器时可保持稳定

1 特性

- 宽输入电压范围 (2.7V 至 10V)
- 所有超薄小外形尺寸无引线封装 (WSON) 选项作为 AEC-Q100 1 级可用
- 2.0% 输出精度 (25°C)
- 低压降: 500mA (5V 输出典型值) 时为 250mV
- 精密 (已调整) 带隙基准
- 可保证 -40°C 至 +125°C 温度范围内的技术规格
- 1 μ A 关闭状态静态电流
- 热过载保护
- 折返电流限制
- TO-252、SOT-223 和 6 凸点晶圆级小外形无引线 (WSON) 封装
- 使能引脚 (LP38693)

2 应用范围

- 硬盘驱动器
- 笔记本电脑
- 电池供电设备
- 便携式仪表

3 说明

LP3869x 低压降 CMOS 线性稳压器具有严密的输出容差 (典型值 2%) 和极低压降 (在负载电流为 500mA、V_{输出} = 5V 时为 250mV)，并且采用超低等效串联电阻 (ESR) 陶瓷输出电容器，可提供出色的交流性能。

此稳压器采用低热阻的 WSON、SOT-223 以及 TO-252 封装，即使在周围温度较高的环境下也可实现满电流运行。

PMOS 功率晶体管的使用意味着无需直流基极驱动电流对其进行偏置，因此无论负载电流、输入电压或者运行温度为何，接地引脚电流均可保持在 100 μ A 以下。

压降: 500mA (5V 输出电压典型值) 条件下为 250mV (典型值)

接地引脚电流: 满负载时为 55 μ A (典型值)

精密输出电压: 精度为 2% (25°C)

器件信息⁽¹⁾

器件型号	封装	封装尺寸 (标称值)
LP38691	TO-252 (3)	6.58mm x 6.10mm
	WSON (6)	3.00mm x 3.00mm
LP38693	SOT-223 (5)	6.50mm x 3.56mm
	WSON (6)	3.00mm x 3.00mm
LP38691-Q1	WSON (6)	3.00mm x 3.00mm
LP38693-Q1

Pin Functions

NAME	PIN				I/O	DESCRIPTION
	TO-252	WSN		SOT-223		
IN	3	1, 6	1, 6	4	I	This is the input supply voltage to the regulator. For WSON devices, both V_{IN} pins must be tied together for full current operation (250mA maximum per pin).
GND	TAB	2	2	5	—	Circuit ground for the regulator. For the PFM and SOT-223 packages this is thermally connected to the die and functions as a heat sink when the soldered down to a large copper plane.
SNS	—	5	5	—	I	WSON Only - Output sense pin allows remote sensing at the load which will eliminate the error in output voltage due to voltage drops caused by the resistance in the traces between the regulator and the load. This pin must be tied to V_{OUT} .
EN	—	—	3	1	I	The enable pin allows the part to be turned ON and OFF by pulling this pin high or low.
OUT	1	4	4	3	O	Regulated output voltage
DAP	—	√	√	—	—	WSON Only - The DAP (Exposed Pad) functions as a thermal connection when soldered to a copper plane. See WSON Mounting section for more information.

7 Specifications

7.1 Absolute Maximum Ratings⁽¹⁾⁽²⁾

	MIN	MAX	UNIT
Lead Temp. (Soldering, 5 seconds)		260	°C
Power Dissipation ⁽³⁾	Internally Limited		V
$V(\text{max})$ All pins (with respect to GND)	–0.3	12	V
$I_{OUT}^{(4)}$	Internally Limited		V
Junction Temperature	–40	150	°C

- (1) Absolute maximum ratings indicate limits beyond which damage to the component may occur. Operating ratings indicate conditions for which the device is intended to be functional, but do not ensure specific performance limits. For ensured specifications, see [Electrical Characteristics](#). Specifications do not apply when operating the device outside of its rated operating conditions.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
- (3) At elevated temperatures, device power dissipation must be derated based on package thermal resistance and heatsink values (if a heatsink is used). When using the WSON package, refer to *AN-1187 Leadless Leadframe Package (LLP)*, *SNOA401*, and the [WSON Mounting](#) section in this datasheet. If power dissipation causes the junction temperature to exceed specified limits, the device will go into thermal shutdown.
- (4) If used in a dual-supply system where the regulator load is returned to a negative supply, the output pin must be diode clamped to ground.

7.2 Handling Ratings: LP3869x

	MIN	MAX	UNIT
T_{stg} Storage temperature range	–65	150	°C

7.6 Electrical Characteristics

Limits in standard typeface are for T_J = 25°C. Unless otherwise specified: V_{IN} = V_{OUT} + 1 V, C_{IN} = C_{OUT} = 10 μF, I_{LOAD} = 10 mA. Min/Max limits are specified through testing, statistical correlation, or design.

PARAMETER		TEST CONDITIONS		MIN	TYP ⁽¹⁾	MAX	UNIT
V _O	Output Voltage Tolerance			–2.0		2.0	%V _{OUT}
		100 μA < I _L < 0.5 A V _O + 1 V ≤ V _{IN} ≤ 10 V Full operating temperature range		–4.0		4.0	
ΔV _O /ΔV _{IN}	Output Voltage Line Regulation ⁽²⁾	V _O + 0.5 V ≤ V _{IN} ≤ 10 V I _L = 25 mA			0.03		%V
		V _O + 0.5 V ≤ V _{IN} ≤ 10 V I _L = 25 mA Full operating temperature range				0.1	
ΔV _O /ΔI _L	Output Voltage Load Regulation ⁽³⁾	1 mA < I _L < 0.5 A V _{IN} = V _O + 1 V			1.8		%A
		1 mA < I _L < 0.5 A V _{IN} = V _O + 1 V Full operating temperature range				5	
V _{IN} – V _{OUT}	Dropout Voltage ⁽⁴⁾	(V _O = 2.5 V)	I _L = 0.1 A		80		mV
			I _L = 0.5 A		430		
		(V _O = 2.5 V) Full operating temperature range	I _L = 0.1 A		145		
			I _L = 0.5 A		725		
		(V _O = 3.3 V)	I _L = 0.1 A		65		
			I _L = 0.5 A		330		
		(V _O = 3.3 V) Full operating temperature range	I _L = 0.1 A		110		
			I _L = 0.5 A		550		
		(V _O = 5 V)	I _L = 0.1 A		45		
			I _L = 0.5 A		250		
		(V _O = 5 V) Full operating temperature range	I _L = 0.1 A		100		
			I _L = 0.5 A		450		

(1) Typical numbers represent the most likely parametric norm for 25°C operation.

(2) Output voltage line regulation is defined as the change in output voltage from nominal value resulting from a change in input voltage.

(3) Output voltage load regulation is defined as the change in output voltage from nominal value as the load current increases from 1 mA to full load.

(4) Dropout voltage is defined as the minimum input to output differential required to maintain the output within 100 mV of nominal value.

Electrical Characteristics (continued)

Limits in standard typeface are for $T_J = 25^\circ\text{C}$. Unless otherwise specified: $V_{IN} = V_{OUT} + 1\text{ V}$, $C_{IN} = C_{OUT} = 10\text{ }\mu\text{F}$, $I_{LOAD} = 10\text{ mA}$. Min/Max limits are specified through testing, statistical correlation, or design.

PARAMETER		TEST CONDITIONS	MIN	TYP ⁽¹⁾	MAX	UNIT
I_Q	Quiescent Current	$V_{IN} \leq 10\text{ V}$, $I_L = 100\text{ }\mu\text{A} - 0.5\text{ A}$		55		μA
		$V_{IN} \leq 10\text{ V}$, $I_L = 100\text{ }\mu\text{A} - 0.5\text{ A}$ Full operating temperature range			100	
		$V_{EN} \leq 0.4\text{ V}$, (LP38693 Only)		0.001	1	
$I_L(\text{MIN})$	Minimum Load Current	$V_{IN} - V_O \leq 4\text{ V}$ Full operating temperature range			100	
I_{FB}	Foldback Current Limit	$V_{IN} - V_O > 5\text{ V}$		350		mA
		$V_{IN} - V_O < 4\text{ V}$		850		
PSRR	Ripple Rejection	$V_{IN} = V_O + 2\text{ V(DC)}$, with $1\text{ V(p-p)} / 120\text{ Hz}$ Ripple		55		dB
T_{SD}	Thermal Shutdown Activation (Junction Temp)			160		$^\circ\text{C}$
$T_{SD}(\text{HYST})$	Thermal Shutdown Hysteresis (Junction Temp)			10		
e_n	Output Noise	$BW = 10\text{ Hz to }10\text{ kHz}$ $V_O = 3.3\text{ V}$		0.7		$\mu\text{V}/\sqrt{\text{Hz}}$
$V_O(\text{LEAK})$	Output Leakage Current	$V_O = V_O(\text{NOM}) + 1\text{ V}$ at 10 V_{IN}		0.5	12	μA
V_{EN}	Enable Voltage (LP38693 Only)	Output = OFF Full operating temperature range			0.4	V
		Output = ON, $V_{IN} = 4\text{ V}$ Full operating temperature range	1.8			
		Output = ON, $V_{IN} = 6\text{ V}$ Full operating temperature range	3.0			
		Output = ON, $V_{IN} = 10\text{ V}$ Full operating temperature range	4.0

8 Detailed Description

8.1 Overview

The LP38691/93 are designed to meet the requirements of portable, battery-powered digital systems providing an accurate output voltage with fast start-up. When disabled via a low logic signal at the enable pin (EN), the power consumption is reduced to virtually zero (LP38693 only).

The LP38691/93 will perform well with a single 1- μ F input capacitor and a single 1- μ F ceramic output capacitor.

8.2 Functional Block Diagrams

Figure 23. LP38691 Functional Diagram (WSON)

Figure 24. LP38691 Functional Diagram (TO-252)

Functional Block Diagrams (continued)

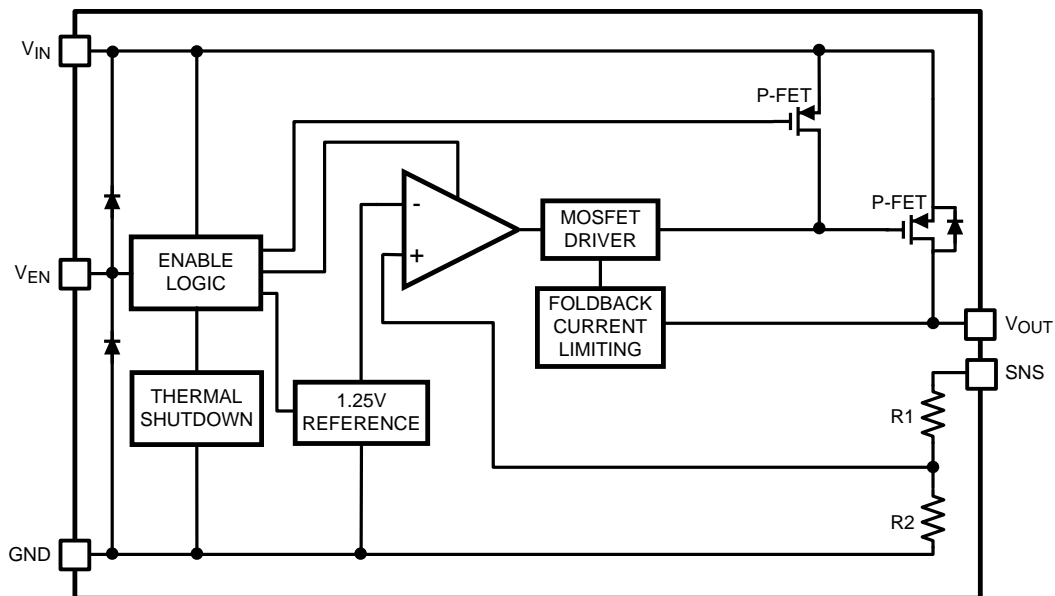

Figure 25. LP38693 Functional Diagram (WSON)

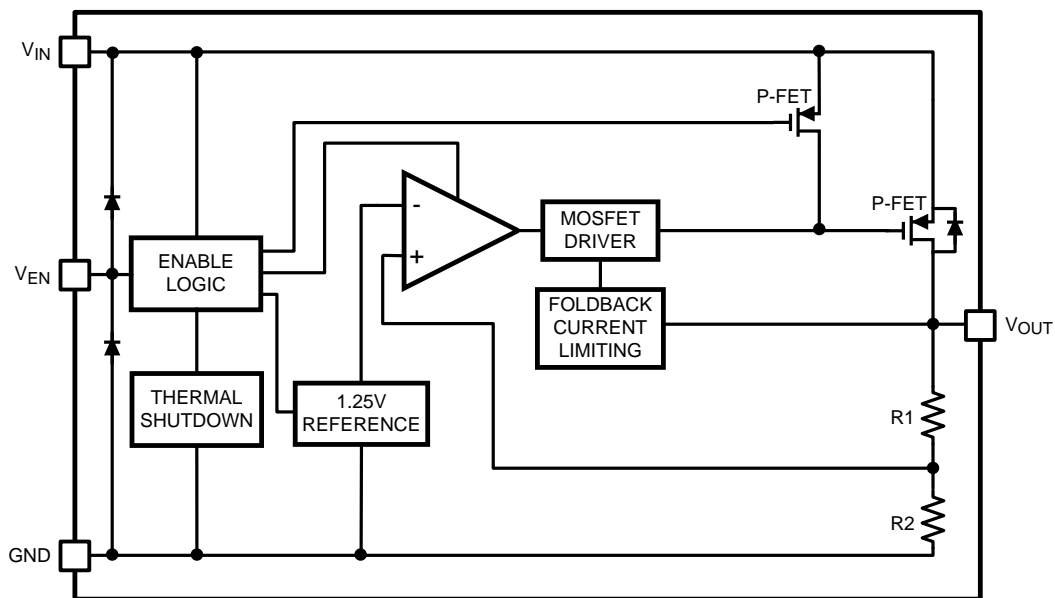

Figure 26. LP38693 Functional Diagram (SOT-223)

8.3 Feature Description

8.3.1 Enable (EN)

The LP38693 has an Enable pin (EN) which allows an external control signal to turn the regulator output On and Off. The Enable On/Off threshold has no hysteresis. The voltage signal must rise and fall cleanly, and promptly, through the ON and OFF voltage thresholds. The EN pin voltage must be higher than the $V_{EN(MIN)}$ threshold to ensure that the device is fully enabled under all operating conditions. The EN pin voltage must be lower than the $V_{EN(MAX)}$ threshold to ensure that the device is fully disabled. The EN pin has no internal pullup or pulldown to establish a default condition and, as a result, this pin must be terminated either actively or passively. If the EN pin is driven from a source that actively pulls high and low, the drive voltage should not be allowed to go below ground potential or higher than V_{IN} . If the application does not require the Enable function, the pin should be connected directly to the V_{IN} pin.

8.3.2 Thermal Overload Protection (TSD)

Thermal Shutdown disables the output when the junction temperature rises to approximately 160°C which allows the device to cool. When the junction temperature cools to approximately 150°C, the output circuitry enables.

Based on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This thermal cycling limits the dissipation of the regulator and protects it from damage as a result of overheating. The Thermal Shutdown circuitry of the LP38693 has been designed to protect against temporary thermal overload conditions.

The Thermal Shutdown circuitry was not intended to replace proper heat-sinking. Continuously running the LP38693 device into thermal shutdown degrades device reliability.

8.3.3 Foldback Current Limiting

Foldback current limiting is built into the LP38691 and LP38693 devices which reduces the amount of output current the part can deliver as the output voltage is reduced. The amount of load current is dependent on the differential voltage between V_{IN} and V_{OUT} . Typically, when this differential voltage exceeds 5 V, the load current will limit at about 350 mA. When the $V_{IN} - V_{OUT}$ differential is reduced below 4 V, load current is limited to about 850 mA.

8.4 Device Functional Modes

8.4.1 Enable (EN)

The EN pin voltage must be higher than the $V_{EN(MIN)}$ threshold to ensure that the device is fully enabled under all operating conditions.

8.4.2 Minimum Operating Input Voltage (V_{IN})

The LP3869x does not include any dedicated UVLO circuitry. The LP3869x internal circuitry is not fully functional until V_{IN} is at least 2.7 V. The output voltage is not regulated until $V_{IN} \geq (V_{OUT} + V_{DO})$, or 2.7 V, whichever is higher.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 Reverse Voltage

A reverse voltage condition will exist when the voltage at the output pin is higher than the voltage at the input pin. Typically this will happen when V_{IN} is abruptly taken low and C_{OUT} continues to hold a sufficient charge such that the input to output voltage becomes reversed. A less common condition is when an alternate voltage source is connected to the output.

There are two possible paths for current to flow from the output pin back to the input during a reverse voltage condition.

1. While V_{IN} is high enough to keep the control circuitry alive, and the Enable pin (LP38693 only) is above the $V_{EN(ON)}$ threshold, the control circuitry will attempt to regulate the output voltage. If the input voltage is less than the programmed output voltage, the control circuit will drive the gate of the pass element to the full ON condition. In this condition, reverse current will flow from the output pin to the input pin, limited only by the $R_{DS(ON)}$ of the pass element and the output to input voltage differential. Discharging an output capacitor up to 1000 μF in this manner will not damage the device as the current will rapidly decay. However, continuous reverse current should be avoided. When the Enable pin is low this condition will be prevented.
2. The internal PFET pass element has an inherent parasitic diode. During normal operation, the input voltage is higher than the output voltage and the parasitic diode is reverse biased. However, when V_{IN} is below the value where the control circuitry is alive, or the Enable pin is low (LP38693 only), and the output voltage is more than 500 mV (typical) above the input voltage the parasitic diode becomes forward biased and current flows from the output pin to the input pin through the diode. The current in the parasitic diode should be limited to less than 1A continuous and 5A peak.

If used in a dual-supply system where the regulator output load is returned to a negative supply, the output pin must be diode clamped to ground to limit the negative voltage transition. A Schottky diode is recommended for this protective clamp.

9.2 Typical Application

* Minimum value required for stability.

**WSO package devices only.

9.2.1 Design Requirements

Table 1. Design Parameters

DESIGN PARAMETERS	EXAMPLE VALUE
Input voltage range	2.7 V to 10 V
Output range	1.8 V
Output current	1 A
Output capacitor range	1 μ F
Input and output capacitor ESR range	5 m Ω to 500 m Ω

9.2.2 Detailed Design Procedure

To begin the design process, determine the following:

- Available input voltage range
- Output voltage needed
- Output current needed
- Input and output capacitors

9.2.2.1 Power Dissipation and Device Operation

The permissible power dissipation for any package is a measure of the capability of the device to pass heat from the power source, the junctions of the IC, to the ultimate heat sink, the ambient environment. Thus, the power dissipation is dependent on the ambient temperature and the thermal resistance across the various interfaces between the die junction and ambient air.

The maximum allowable power dissipation for the device in a given package can be calculated using [Equation 1](#):

$$P_{D-MAX} = ((T_{J-MAX} - T_A) / R_{\theta JA}) \quad (1)$$

The actual power being dissipated in the device can be represented by [Equation 2](#):

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (2)$$

These two equations establish the relationship between the maximum power dissipation allowed due to thermal consideration, the voltage drop across the device, and the continuous current capability of the device. These two equations should be used to determine the optimum operating conditions for the device in the application.

In applications where lower power dissipation (P_D) and/or excellent package thermal resistance ($R_{\theta JA}$) is present, the maximum ambient temperature (T_{A-MAX}) may be increased.

In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature (T_{A-MAX}) may have to be derated. T_{A-MAX} is dependent on the maximum operating junction temperature ($T_{J-MAX-OP} = 125^\circ\text{C}$), the maximum allowable power dissipation in the device package in the application (P_{D-MAX}), and the junction-to ambient thermal resistance of the part/package in the application ($R_{\theta JA}$), as given by [Equation 3](#):

$$T_{A-MAX} = (T_{J-MAX-OP} - (R_{\theta JA} \times P_{D-MAX})) \quad (3)$$

Alternately, if T_{A-MAX} can not be derated, the P_D value must be reduced. This can be accomplished by reducing V_{IN} in the ' $V_{IN}-V_{OUT}$ ' term as long as the minimum V_{IN} is met, or by reducing the I_{OUT} term, or by some combination of the two.

9.2.2.2 External Capacitors

In common with most regulators, the LP3869x requires external capacitors for regulator stability. The LP3869x is specifically designed for portable applications requiring minimum board space and smallest components. These capacitors must be correctly selected for good performance.

9.2.2.3 Input Capacitor

An input capacitor is required for stability. It is recommended that a 1- μ F capacitor be connected between the LP3869x IN pin and GND pin (this capacitance value may be increased without limit).

This capacitor must be located a distance of not more than 1 cm from the IN pin and returned to a clean analogue ground. Any good quality ceramic, tantalum, or film capacitor may be used at the input.

Important: To ensure stable operation it is essential that good PCB design practices are employed to minimize ground impedance and keep input inductance low. If these conditions cannot be met, or if long leads are used to connect the battery or other power source to the LP3869x, then it is recommended that the input capacitor is increased. Also, tantalum capacitors can suffer catastrophic failures due to surge current when connected to a low-impedance source of power (like a battery or a very large capacitor). If a tantalum capacitor is used at the input, it must be ensured by the manufacturer to have a surge current rating sufficient for the application.

There are no requirements for the ESR (equivalent series resistance) on the input capacitor, but tolerance and temperature coefficient must be considered when selecting the capacitor to ensure the capacitance will remain approximately 1 μF over the entire operating temperature range.

9.2.2.4 Output Capacitor

The LP3869x is designed specifically to work with very small ceramic output capacitors. A 1- μF ceramic capacitor (temperature types Z5U, Y5V or X7R/X5R) with ESR between 5 m Ω to 500 m Ω , is suitable in the LP3869x application circuit.

For this device the output capacitor should be connected between the OUT pin and GND pin.

It is also possible to use tantalum or film capacitors at the device output, but these are not as attractive for reasons of size and cost.

The output capacitor must meet the requirement for the minimum value of capacitance and also have an ESR value that is within the range 5 m Ω to 500 m Ω for stability.

9.2.2.5 No-Load Stability

The LP3869x will remain stable and in regulation with no external load. This is an important consideration in some circuits, for example CMOS RAM keep-alive applications.

9.2.2.6 Capacitor Characteristics

The LP3869x is designed to work with ceramic capacitors on the output to take advantage of the benefits they offer. For capacitance values in the range of 0.47 μF to 4.7 μF , ceramic capacitors are the smallest, least expensive and have the lowest ESR values, thus making them best for eliminating high frequency noise. The ESR of a typical 1- μF ceramic capacitor is in the range of 20 m Ω to 40 m Ω , which easily meets the ESR requirement for stability for the LP3869x.

For both input and output capacitors, careful interpretation of the capacitor specification is required to ensure correct device operation. The capacitor value can change greatly, depending on the operating conditions and capacitor type.

In particular, the output capacitor selection should take account of all the capacitor parameters, to ensure that the specification is met within the application. The capacitance can vary with DC bias conditions as well as temperature and frequency of operation. Capacitor values will also show some decrease over time due to aging. The capacitor parameters are also dependent on the particular case size, with smaller sizes giving poorer performance figures in general. As an example, [Figure 27](#) shows a typical graph comparing different capacitor case sizes in a Capacitance vs. DC Bias plot. As shown in the graph, increasing the DC Bias condition can result in the capacitance value falling below the minimum value given in the recommended capacitor specifications table (0.7 μF in this case). Note that the graph shows the capacitance out of specification for the 0402 case size capacitor at higher bias voltages. It is therefore recommended that the capacitor manufacturers' specifications for the nominal value capacitor are consulted for all conditions, as some capacitor sizes (for example, 0402) may not be suitable in the actual application.

Figure 27. Typical Variation In Capacitance vs DC Bias

The value of the ceramic capacitor can vary with temperature. The capacitor type X7R, which operates over a temperature range of -55°C to 125°C , will only vary the capacitance to within $\pm 15\%$. The capacitor type X5R has a similar tolerance over a reduced temperature range of -55°C to 85°C . Many large value ceramic capacitors, larger than $1\text{ }\mu\text{F}$ are manufactured with Z5U or Y5V temperature characteristics. Their capacitance can drop by more than 50% as the temperature varies from 25°C to 85°C . Therefore, X7R and X5R types are recommended over Z5U and Y5V in applications where the ambient temperature will change significantly above or below 25°C .

Tantalum capacitors are less desirable than ceramic for use as output capacitors because they are more costly when comparing equivalent capacitance and voltage ratings in the $0.47\text{-}\mu\text{F}$ to $4.7\text{-}\mu\text{F}$ range.

Another important consideration is that tantalum capacitors have higher ESR values than equivalent size ceramics. This means that while it may be possible to find a tantalum capacitor with an ESR value within the stable range, it would have to be larger in capacitance (which means bigger and more costly) than a ceramic capacitor with the same ESR value. It should also be noted that the ESR of a typical tantalum will increase about 2:1 as the temperature goes from 25°C down to -40°C , so some guard band must be allowed.

9.2.2.7 RFI/EMI Susceptibility

RFI (radio frequency interference) and EMI (electromagnetic interference) can degrade any integrated circuit's performance because of the small dimensions of the geometries inside the device. In applications where circuit sources are present which generate signals with significant high frequency energy content ($> 1\text{ MHz}$), care must be taken to ensure that this does not affect the IC regulator.

If RFI/EMI noise is present on the input side of the regulator (such as applications where the input source comes from the output of a switching regulator), good ceramic bypass capacitors must be used at the input pin of the IC.

If a load is connected to the IC output which switches at high speed (such as a clock), the high-frequency current pulses required by the load must be supplied by the capacitors on the IC output. Because the bandwidth of the regulator loop is less than 100 kHz , the control circuitry cannot respond to load changes above that frequency. This means the effective output impedance of the IC at frequencies above 100 kHz is determined only by the output capacitors.

In applications where the load is switching at high speed, the output of the IC may need RF isolation from the load. It is recommended that some inductance be placed between the output capacitor and the load, and good RF bypass capacitors be placed directly across the load.

PCB layout is also critical in high noise environments, because RFI/EMI is easily radiated directly into PC traces. Noisy circuitry should be isolated from *clean* circuits where possible, and grounded through a separate path. At MHz frequencies, ground planes begin to look inductive and RFI/EMI can cause ground bounce across the ground plane. In multi-layer PCB applications, care should be taken in layout so that noisy power and ground planes do not radiate directly into adjacent layers which carry analog power and ground.

9.2.2.8 Output Noise

Noise is specified in two ways: **Spot Noise** or **Output Noise Density** is the RMS sum of all noise sources, measured at the regulator output, at a specific frequency (measured with a 1Hz bandwidth). This type of noise is usually plotted on a curve as a function of frequency. **Total Output Noise** or **Broad-Band Noise** is the RMS sum of spot noise over a specified bandwidth, usually several decades of frequencies.

Attention should be paid to the units of measurement. Spot noise is measured in units $\mu\text{V}/\sqrt{\text{Hz}}$ or $\text{nV}/\sqrt{\text{Hz}}$ and total output noise is measured in $\mu\text{V}(\text{rms})$.

The primary source of noise in low-dropout regulators is the internal reference. Noise can be reduced in two ways: by increasing the transistor area or by increasing the current drawn by the internal reference. Increasing the area will decrease the chance of fitting the die into a smaller package. Increasing the current drawn by the internal reference increases the total supply current (ground pin current).

9.2.3 Application Curves

Figure 28. V_{OUT} vs V_{EN} , ON (LP38693 Only)

Figure 29. V_{OUT} vs V_{EN} , OFF (LP38693 Only)

10 Power Supply Recommendations

The LP3869x is designed to operate from an input supply voltage range of 2.7 V to 10 V. The input supply should be well regulated and free of spurious noise. To ensure that the LP3869x output voltage is well regulated, the input supply should be at least $V_{OUT} + 0.5\text{ V}$, or 2.7 V, whichever is higher. A minimum capacitor value of 1- μF is required to be within 1 cm of the IN pin.

11 Layout

11.1 Layout Guidelines

The dynamic performance of the LP3869x is dependent on the layout of the PCB. PCB layout practices that are adequate for typical LDOs may degrade the load regulation, PSRR, noise, or transient performance of the LP3869x.

Best performance is achieved by placing C_{IN} and C_{OUT} on the same side of the PCB as the LP3869x, and as close as is practical to the package. The ground connections for C_{IN} and C_{OUT} should be back to the LP3869x ground pin using as wide, and as short, a copper trace as is practical.

Connections using long trace lengths, narrow trace widths, and/or connections through vias should be avoided. These will add parasitic inductances and resistance that results in inferior performance especially during transient conditions.

A Ground Plane, either on the opposite side of a two-layer PCB, or embedded in a multi-layer PCB, is strongly recommended. This Ground Plane serves two purposes:

- Provides a circuit reference plane to assure accuracy.
- Provides a thermal plane to remove heat from the LP3869x WSON package through thermal vias under the package DAP.

11.1.1 WSON Mounting

The NGG0006A (No Pullback) 6-Lead WSON package requires specific mounting techniques which are detailed in the TI *AN-1187 Application Report SNOA401*. Referring to the section PCB Design Recommendations (Page 5), it should be noted that the pad style which should be used with the WSON package is the NSMD (non-solder mask defined) type. Additionally, it is recommended the PCB terminal pads to be 0.2-mm longer than the package pads to create a solder fillet to improve reliability and inspection.

The input current is split between two V_{IN} pins, 1 and 6. The two V_{IN} pins must be connected together to ensure that the device can meet all specifications at the rated current.

The thermal dissipation of the WSON package is directly related to the printed circuit board construction and the amount of additional copper area connected to the DAP.

The DAP (exposed pad) on the bottom of the WSON package is connected to the die substrate with a conductive die attach adhesive. The DAP has no direct electrical (wire) connection to any of the pins. There is a parasitic PN junction between the die substrate and the device ground. As such, it is strongly recommend that the DAP be connected directly to the ground at device lead 2 (that is, GND). Alternately, but not recommended, the DAP may be left floating (that is, no electrical connection). The DAP must not be connected to any potential other than ground.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

OTHER QUALIFIED VERSIONS OF LP38691, LP38691-Q1, LP38693, LP38693-Q1 :

重要声明

德州仪器 (TI) 公司有权按照最新发布的 JESD46 对其半导体产品和服务进行纠正、增强、改进和其他修改，并不再按最新发布的 JESD48 提供任何产品和服务。买方在下订单前应获取最新的相关信息，并验证这些信息是否完整且是最新的。

TI 公布的半导体产品销售条款 (<http://www.ti.com/sc/docs/stdterms.htm>) 适用于 TI 已认证和批准上市的已封装集成电路产品的销售。另有其他条款可能适用于其他类型 TI 产品及服务的使用或销售。

复制 TI 数据表上 TI 信息的重要部分时，不得变更该等信息，且必须随附所有相关保证、条件、限制和通知，否则不得复制。TI 对该等复制文件不承担任何责任。第三方信息可能受到其它限制条件的制约。在转售 TI 产品或服务时，如果存在对产品或服务参数的虚假陈述，则会失去相关 TI 产品或服务的明示或暗示保证，且构成不公平的、欺诈性商业行为。TI 对此类虚假陈述不承担任何责任。

买方和在系统中整合 TI 产品的其他开发人员（总称“设计人员”）理解并同意，设计人员在设计应用时应自行实施独立的分析、评价和判断，且应全权负责并确保应用的安全性，及设计人员的应用（包括应用中使用的 TI 产品）应符合所有适用的法律法规及其他相关要求。设计人员就自己设计的应用声明，其具备制订和实施下列保障措施所需的一切必要专业知识，能够 (1) 预见故障的危险后果，(2) 监视故障及其后果，以及 (3) 降低可能导致危险的故障几率并采取适当措施。设计人员同意，在使用或分发包含 TI 产品的任何应用前，将彻底测试该等应用和该等应用中所用 TI 产品的功能。

TI 提供技术、应用或其他设计建议、质量特点、可靠性数据或其他服务或信息，包括但不限于与评估模块有关的参考设计和材料（总称“TI 资源”），旨在帮助设计人员开发整合了 TI 产品的应用，如果设计人员（个人，或如果是代表公司，则为设计人员的公司）以任何方式下载、访问或使用任何特定的 TI 资源，即表示其同意仅为该等目标，按照本通知的条款使用任何特定 TI 资源。

TI 所提供的 TI 资源，并未扩大或以其他方式修改 TI 对 TI 产品的公开适用的质保及质保免责声明；也未导致 TI 承担任何额外的义务或责任。TI 有权对其 TI 资源进行纠正、增强、改进和其他修改。除特定 TI 资源的公开文档中明确列出的测试外，TI 未进行任何其他测试。

设计人员只有在开发包含该等 TI 资源所列 TI 产品的应用时，才被授权使用、复制和修改任何相关 TI 资源。但并未依据禁止反言原则或其他法律授予您任何 TI 知识产权的任何其他明示或默示的许可，也未授予您 TI 或第三方的任何技术或知识产权的许可，该等许可包括但不限于任何专利权、版权、屏蔽作品权或与其他 TI 产品或服务的任何整合、机器制作、流程相关的其他知识产权。涉及或参考了第三方产品或服务的信息不构成使用此类产品或服务的许可或与其相关的保证或认可。使用 TI 资源可能需要您向第三方获得对该等第三方专利或其他知识产权的许可。

TI 资源系“按原样”提供。TI 兹免除对资源及其使用作出所有其他明确或默示的保证或陈述，包括但不限于对准确性或完整性、产权保证、无屡发故障保证，以及适销性、适合特定用途和不侵犯任何第三方知识产权的任何默认保证。TI 不负任何责任，包括但不限于因组合产品所致或与之有关的申索，也不为或对设计人员进行辩护或赔偿，即使该等产品组合已列于 TI 资源或其他地方。对因 TI 资源或其使用引起或与之有关的任何实际的、直接的、特殊的、附带的、间接的、惩罚性的、偶发的、从属或惩戒性损害赔偿，不管 TI 是否获悉可能会产生上述损害赔偿，TI 概不负责。

除 TI 已明确指出特定产品已达到特定行业标准（例如 ISO/TS 16949 和 ISO 26262）的要求外，TI 不对未达到任何该等行业标准要求而承担任何责任。

如果 TI 明确宣称产品有助于功能安全或符合行业功能安全标准，则该等产品旨在帮助客户设计和创作自己的符合相关功能安全标准和要求的的应用。在应用内使用产品的行为本身不会配有安全特性。设计人员必须确保遵守适用于其应用的相关安全要求和标准。设计人员不可将任何 TI 产品用于关乎性命的医疗设备，除非已由各方获得授权的管理人员签署专门的合同对此类应用专门作出规定。关乎性命的医疗设备是指出现故障会导致严重身体伤害或死亡的医疗设备（例如生命保障设备、心脏起搏器、心脏除颤器、人工心脏泵、神经刺激器以及植入设备）。此类设备包括但不限于，美国食品药品监督管理局认定为 III 类设备的设备，以及在美国以外的其他国家或地区认定为同等类别设备的所有医疗设备。

TI 可能明确指定某些产品具备某些特定资格（例如 Q100、军用级或增强型产品）。设计人员同意，其具备一切必要专业知识，可以为自己的应用选择适合的产品，并且正确选择产品的风险由设计人员承担。设计人员单方面负责遵守与该等选择有关的所有法律或监管要求。

设计人员同意向 TI 及其代表全额赔偿因其不遵守本通知条款和条件而引起的任何损害、费用、损失和/或责任。
